630593 001 NONCONTACT COOL.H2O TO CLINTON R.VIA DRN

A visit was made to the GM Truck & Coach plant in Pontiac on 10/12/77 regarding the proposed permit revision for Polychlorinated Biphenyls (PCB). On Dec. 11, 1975 and March 5, 1976 grab samples were taken of the discharge of non contact cooling water and surface runoff. Both samples contained PCB type 1260 of .68 ug/l and .54 ug/l respectively. During my visit samples were again taken, sample #1 taken at the company's sampling point, a manhole on South Boulevard, sample #2 was taken inside the plant at a point where the cooling water is discharged into a tank before being discharged to the storm sewer. Looking down the manhole a slight rainbow film could be seen. An inspection of the non contact cooling water discharge to the Murphy Drain revealed a slight amount of foam caused by the discharge. Further plans are to recirculate the non contact cooling water and eliminate the discharge to Murphy Drain except for storm runoff.
